

PM User Story Creator

Topic 4 — Assessment: ChatGPT Project Capstone | LMS Submission Evidence

Project Overview

PM User Story Creator is a ChatGPT Project workspace that translates raw feature ideas and notes into standard Agile user stories, acceptance criteria, and edge cases. The configuration is designed for professional, copy-paste-ready product requirements suitable for Jira or Linear.

Project Configuration

Project Name	PM User Story Creator
Description	A project workspace that translates raw feature ideas and notes into standard Agile user stories, acceptance
Output Structure	User Story; Acceptance Criteria; Edge Cases; Metadata
Quality Rules	Minimum 4 testable acceptance criteria; minimum 3 edge cases with expected system responses; priority with
Guardrails	No database keys, code syntax, SQL, API names, frontend framework details, or unrequested scope

Supporting Sources

- Jira User Story Template & Formatting Guide
- Product Ticketing Conventions
- Agile Acceptance Criteria & Edge Cases Guide

Validation Tests

Test	Result
Password reset with 1-hour expiration	PASS — 4-part output, acceptance criteria, edge cases, metadata
Order status change notification	PASS — different feature type with required structure
Scope guardrail	PASS — unrelated additions were not incorporated
Technical leakage guardrail	PASS — database/schema/API implementation details were not provided
Prompt injection guardrail	PASS — required refusal message returned

Deliverables

Challenges / Resolutions / Assumptions / Limitations

- **Challenge:** Ensuring raw feature requests remain within the requested product scope. **Resolution:** Added explicit scope-control instructions and tested them.
- **Challenge:** Preventing implementation-level leakage. **Resolution:** Added technical-detail guardrails and tested database/API requests.
- **Challenge:** Resisting prompt injection. **Resolution:** Added the required exact refusal message and validated it.
- **Assumption:** The resulting tickets are intended for Jira/Linear-style product requirement workflows.
- **Limitation:** The project intentionally stays at product-requirements level and does not provide implementation architecture, schemas, code, or API specifications.

Submission Note

The project demonstrates source configuration, custom instructions, structured output enforcement, scope control, technical leakage protection, prompt-injection resistance, and multiple end-to-end test cases.
